simplicity and operational freedom

High levels of efficiency, interoperability and flexibility to meet any need, from single installation to multi-site systems.

The versatility and functionality of our solution makes it possible to design **advanced control strategies**, customized according to the user's specific needs and mainly aimed at efficiency and energy saving.

The range of **freely programmable** controllers and expansion modules as well as the software design provides countless **unique solutions**.

Just as in an organism, in every building-plant system the balanced interaction of all components makes it possible to supply **the right energy at the right time**, at the lowest cost.

Web Garage licenses have no point limits and no expiration date. The license is sold at fixed price, with no recurring royalties. **It allows infinite simultaneous accesses**.
The programming and supervision logic of the plants is available to the customer as source code and can be modified independently.

BUILDING ENERGY WELLNESS, FOR BUILDINGS

Our method for energy wellness is a virtuous path along which Coster Group is a guide and trainer.

It consists of a few precise rules for constant improvement in performance.

THE METHOD

MONITORING

awareness of energy use

ANALYSIS

interpretation of data obtained

ACTION

energy regulated according to the building requirements

MAINTENANCE

constant performance over time

Our consumption monitoring solutions make the performance and comfort levels of the building-plant system visible at all times.
Consumption awareness in energy management can generate significant savings(up to 15%).

From a systematic data analysis and in-depth knowledge of the plant assets, to the identification of the opportunities for improvement of a system in terms of redevelopment, **replacement of components and introduction of automation.**

Actions follow the analysis:
Investment decisions are based on achieving efficiency and maximum reliability. Targeted upgrades and changes for specific objectives in terms of energy savings and plant regeneration, with the most suitable and least expensive technological solutions. Thanks to our interventions, achieved savings ranged between 25% and 70%.

The required path is completed with control and maintenance functions: the monitoring system ensures that the achievement of objectives is constantly verified, maintenance is checked and new efficiency measures are identified and assessed.

WEBGARAGE

OPEN INTEGRATION

The distances between the plant and the office are eliminated.

The platform integrates the basic functionality of a **Building Automation System (BACS)** which supervises and controls **HVAC systems**, offers the additional benefits of a **Building Operating System (BOS)** to govern, display and give value to relevant data.
The technology on which it is developed uses tagging and data modeling to ensure functionality and potential still unexplored.

Communication between the Control Centre and the Peripheral Units is bidirectional and can use either a telephone SIM M2M or Ethernet connection.

WebGarage by Coster Group allows to collect, control and integrate data from different systems in order to optimise a building performance for its occupants in terms of comfort, productivity, energy efficiency and sustainability.

The platform allows to remotely supervise and manage the two generations of Coster Group controllers, X-series and Y-series.

For small plants and non web based applications it is always possible to use the Coster Office remote management software

COMFORT

Heating/cooling stations; substations; environments; comfort and energy saving with Zero-Km management.

AIR TREATMENT

Stand alone or integrated solutions for controlling air treatment units

MONITORING

For metering and acquiring all the buildings consumption data and their environmental parameters.

DOMESTIC HOT WATER

Efficient solutions for temperature controlled production and distribution.

Full adjustment, easily programmable, web-based plant supervision

For the automation, management and supervision of technological systems we offer a complete and integrated range of DDC

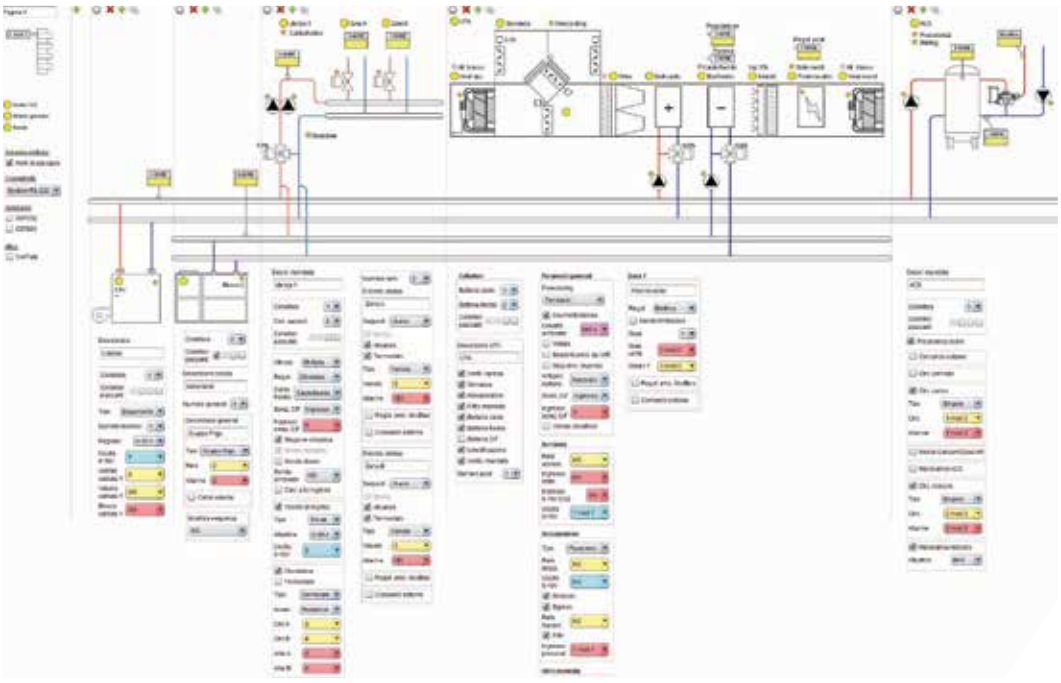
We supply complete remote control and telemanagement of plants to operators who use and perform maintenance on the systems by means of the latest generation connectivity.

Logic functions pre-engineered and configured by the customer

costercad

Each item selected from the menu is interpreted by the software as a tile of the control system. The file generated by CAD provides the device with the necessary information to control the plant, communicate with the outside, configure the user interface, recognize and send alarms.

The software also implements the terminal board wiring diagram for the controller according to the control logic of the function blocks selected from the menu.



Compose your system, assemble function blocks easily and immediately

Selection methods according to the system to be powered

- Calculate the total power absorbed Pt in VA of the system that must be fed by adding together all the absorption of the individual components of the system: Pr detectors, Ps sensors (SRS only), Pv valves, external Pa alarms.

  The absorption of SGC, SGR sensors must not be considered, as it is already calculated in the detectors that feed them.
  Pt = Pr + Ps + Pv +Pa. The power of the power supply unit must be greater than or equal to Pt.
- Multiply the absorbed power Pt by the number of hours h that you want, so as to keep the system efficient without the mains, to obtain the necessary effective power Pe.
  Pe = Pt x h. The power of the accumulator must not be less than Pe.
  If a single accumulator is not sufficient, use more accumulators in parallel.

FUNCTIONAL CHARACTERISTICS OF THE GAS SOLENOID VALVES

Type	Operation	Pros	Cons
Normally closed GCAO... GCA...	With no power it closes. With power it opens	Ideal for thermal control units. In case of gas leaks, the detector eliminates the power supply to the valve. The power supply is restored only with the detector being manually reset. In the event of a power failure, the valve closes; when it is restored, the valve re-opens automatically.	Not recommended in kitchens without a thermocouple. In the event of a power failure the valve closes and the flame goes out; when the power is restored, the valve re-opens and the gas escapes, thereby posing a hazardous situation.
Normally closed with manual reset GCRO... GCR...	With no power it closes. With power it opens only with manual action	Maximum safety in every use	Every time the power is interrupted, the valve closes. When the power is restored, it must be reopened manually. Not suitable for kitchens because, in the event of a power failure, the user tends to reopen the valve with mechanical artifices. When the power is restored, the safety system is no longer operational
Normally open with manual reset GARO ... GAR ...	With power it opens only with manual action. With no power it opens only with manual action	In the kitchen it is possible to use the gas even in the event of a power failure. In the thermal control unit, in the event of a power failure, the valve remains open and the burner safety systems intervene. When the power supply is restored, no manual intervention is required to restart the system.	In the event of a power failure, the valve remains open and the gas safety system remains active only if it is powered by a buffer battery. Currently they cannot be approved.

ELECTROTHERMAL LINEAR ACTUATORS FOR VFC VALVES

These are the motors used for the automation of VFC type of valves.
Motor valve coupling adapter included (VA80)
The servo motors are of electrothermal type and therefore they are released in the event of no supply voltage.
The VFC valves are normally open. They close when the motor is mounted and there is no power supply.
